Implementation of Boolean Function with GATES

Minimization of Switching Functions

Unit-II

Topics:

- **Karnaugh Map Method**
- **Prime Implicants**
- **Don't Care Combinations**
- **Minimal SOP and POS forms**
- **Quine Mc Cluskey Tabular Method**
- **Prime Implicant Chart**
- **Simplification Rules**

Simplifying Switching Functions

- **SOP and POS expressions**

==> 2-level circuits

Minimum SOP/POS expression:

- **Minimize the number of literals**
- **Minimum number of terms**

How?

- **Algebraically: I.e. using the axioms and theorems of Boolean algebra.**
- **Karnaugh Map**
- **McCluskey Method**

Simplifying Switching Functions: K-Map

Simplifying Theorem:

$$XY + X'Y = Y$$

Definition: Logical Adjacency

- **Two terms are logically adjacent if they differ in only one literal: the literal is complemented in one term and non-complemented in the other.**

- **Two Logically adjacent terms can be combined into one term consisting of only the common literals**

Karnaugh-Map (K-Map)

2-dimensional representation of a truth table.

Logically adjacent terms are physically adjacent in the map.

2-Variable Functions:

$$F(X,Y) = XY + X'Y$$

	X Y	F(X,Y)
m0	0 0	
m1	0 1	
m2	1 0	
m3	1 1	

2-Variable K-Map

X \ Y	0	1
0	00	10
1	01	11

X \ Y	0	1
0	$X'Y'$	XY'
1	$X'Y$	XY

X \ Y	0	1
0	m0	m2
1	m1	m3

Note:

- Logically adjacent cells are physically adjacent in the k-map
- Each cells has two adjacent cells

Function Minimization Using K-Maps

1. Each square (minterm) in a k-map of 2 variables has 2 logically adjacent squares, each square in a 3-variable k-map has 3 adjacent squares, etc.
2. Combine only the minterms for which the function is 1.
3. When combining terms on a k-map, group adjacent squares in groups of powers of 2 (i.e. 2, 4, 8, etc.). Grouping two squares eliminates one variables, grouping 4 squares eliminates 2 variables, etc.
 - Can't combine a group of 3 minterms

Function Minimization Using K-Maps

4. Group as many squares together as possible; the larger the group is the fewer the number of literals in the resulting product term
5. Select as few groups as possible to cover all the minterms of the functions. A minterm is **covered** if it is included in at least one group. Each minterm may be covered as many times as it is needed; however, it must be covered at least once.
6. In combining squares on the map, always begin with those squares for which there are the fewest number of adjacent squares (the “loneliest” squares on the map).

Definitions

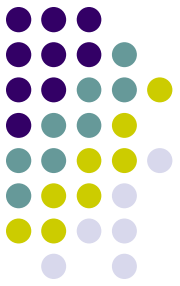

- **Implicant:** a product term that could be used to cover one or more minterms
- **Prime Implicant:** A product term obtained by combining the maximum number of adjacent squares in the map.
- **Essential Prime Implicant:** A prime implicant that covers at least one minterm that is not covered by any other prime implicant.
 - All essential prime implicants must be included in the final minimal expression.

Definitions (Cont.)

- **Cover of function:** is a set of prime implicants for which each minterm of the function is covered by at least one prime implicant.
- All essential prime implicants must be included in the cover of a function.

Algorithm for Deriving the Minimal SOP

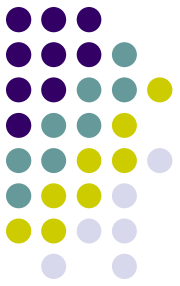

- **1. Circle all prime implicants on the k-map**
- **2. Identify and select all essential prime implicants**
- **3. Select a minimum subset of the remaining prime implicants to cover those minterms not covered by the essential prime implicants.**

More Examples

Find min. SOP and POS expression for each of the following functions

1. $F(A,B,C,D) = \Sigma m(2,3,5,7,10,11,13,14,15)$
2. $G(W,X,Y,Z) = \Pi M(1,3,4,5,7)$
3. $H(A,B,C,D) = \Sigma m(1,3,4,7,11) + d(5,12,13,14,15)$
4. $F2(A,B,C,D) = \Sigma m(1,2,7,12,15) + d(5,9,10,11,13)$
5. $F3(A,B,C,D,E) = \Sigma m(0,1,2,4,5,6,13,15,16,18,22,24,26,29)$

Tabulation Method

Tabulation Method

- **Map method is a trial-and-error procedure**
- **Tabulation method performs thorough search**
- **It starts with SOM and consists of 2 steps:**
 - **PIs generation**
 - **group minterms by number of 1s**
 - **compare minterms & find pairs that differ in 1 variable**
 - **generate subcubes**
 - **repeat the above 3 steps to generate subcubes until no more subcubes can be generated**
 - **Minimal cover generation**
 - **find EPIs through a selection table**
 - **find minimal cover through the POS of PIs**

Example: simplify $w'y'z' + wz + xyz + w'y$
